Textual Analysis in Finance - Mid-term Assignment

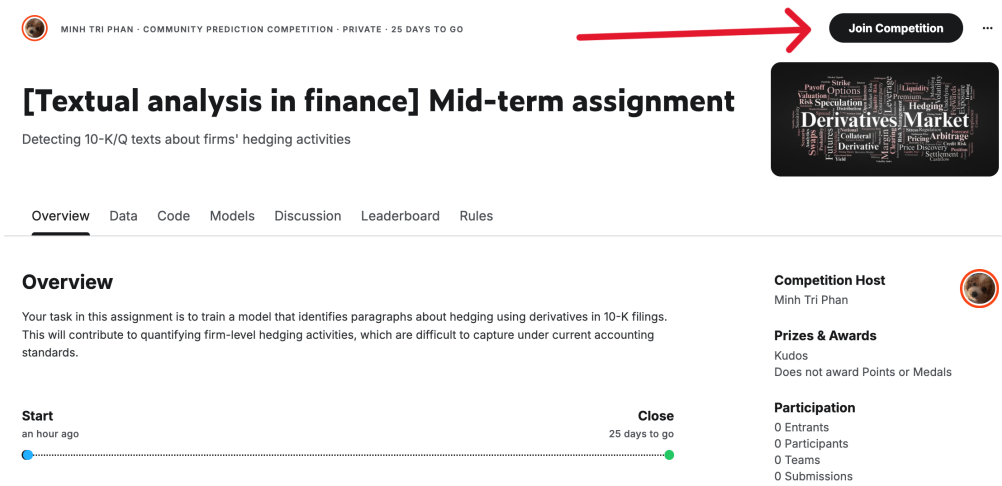
Identifying paragraphs about hedging using derivatives

April 22, 2026

General instruction

The mid-term assignment is structured as a Kaggle competition. Your task is to identify paragraphs that describe firms' hedging activities using derivatives. These paragraphs are extracted from 10-K and 10-Q filings.

To participate, start by joining the competition via this link, then click on **Join Competition** in the top-right corner, as shown in the figure below. If you are not logged in, Kaggle will ask you to do so.



Begin by carefully reading the Overview tab. This section provides essential information about the assignment's context, timeline, evaluation criteria, and grading scheme.

Next, review the Data tab to familiarize yourself with the dataset.

To start coding, go to the Code tab and click on + **New Notebook**. Once the editor opens in a new tab, upload the "Example code.ipynb" notebook by selecting **File** (top left corner), then **Import Notebook**. You can find this notebook on ADAM in the **Assignment** folder. It demonstrates how to load the data and generate a submission file, and you are encouraged to build your solution within it.

After generating a valid submission file, submit your predictions by navigating to the **Submit to competition** panel on the left-hand side of your notebook. Click the **Submit** button to upload your notebook. Your predictions will be evaluated automatically.

Once your submission is successful, your score will appear on the Leaderboard tab. Note that this score reflects performance on only 25% of the test data. The final score will be based on the remaining 75%, which is hidden to simulate real-world conditions and prevent look-ahead bias.

If you have questions or would like to discuss the assignment, you can use the Discussion tab.

Now, good luck and happy Kaggling!
